

Project Title: Sentiment Analysis in Amazon Product Reviews.

By: Vadluri Dineshwar

Date: May 3, 2026

Insights & Summary

My analysis shows that the vast majority of reviews (about 88.3%) are positive, which is a great sign for the brand. However, the negative feedback highlights a clear problem with shipping and packaging durability that needs to be fixed. One interesting thing I noticed while checking the data is that star ratings and text sentiment don't always match; some people give 5 stars but write very "neutral" text, which confused the sentiment score slightly. Based on these findings, the business should prioritize improving their logistics and box quality to reduce complaints and keep the momentum going.
